STUDENT MANAGEMENT SYSTEM

A Student Management System is a software application designed to store, organize, and manage student information efficiently. It helps maintain important details such as student names, roll numbers, and marks in a systematic way. Instead of keeping records manually on paper, this system allows data to be stored digitally, making it easier to access and manage student INFORMATION.

The system provides basic features such as adding new student records, displaying all student details, searching for a particular student, and calculating average marks. These functions help users quickly find and analyze student data. By using a menu-driven program, the user can choose different options to perform specific tasks, which makes the system simple and user-friendly.

This project is developed using C++ programming language and uses fundamental programming concepts such as structures, arrays, loops, and conditional statements. It is especially useful for beginners to understand how programming can be used to build small real-world applications that help manage data effectively.
